

Bosch spexor

Dashboard redesign for B2B

Use case: Monitoring indoor air quality in office spaces

PROJECT OVERVIEW

spexor is a mobile alarm system of the Bosch brand, combining an IoT device and a smartphone app for remote management. Originally designed for the B2C market, spexor has also been increasingly used internally at Bosch, exploring B2B opportunities. However, business users were still using the B2C app. While private customers typically connect one or two spexor devices with the app, business users manage a significantly larger number, which affects the usability of the app. The goal of this project was to identify the pain points of business users in the current spexor app and design a new dashboard that meets B2B needs.

ROLE

Product Designer & Developer

TIMELINE

January - April 2022

TOOLS

Sketch, Xcode

PROBLEM STATEMENT

Designed for the B2C market, the usability of the spexor app is increasingly impaired the more devices are registered in the app.

What is spexor?

spexor is an IoT product that uses smart sensor technology to detect and warn users of various everyday dangers, such as burglaries or indoor air pollution. spexor can be monitored and controlled via its dedicated smartphone app. Users can buy additional features via in-app purchases to customise spexor to their needs.

Features include:

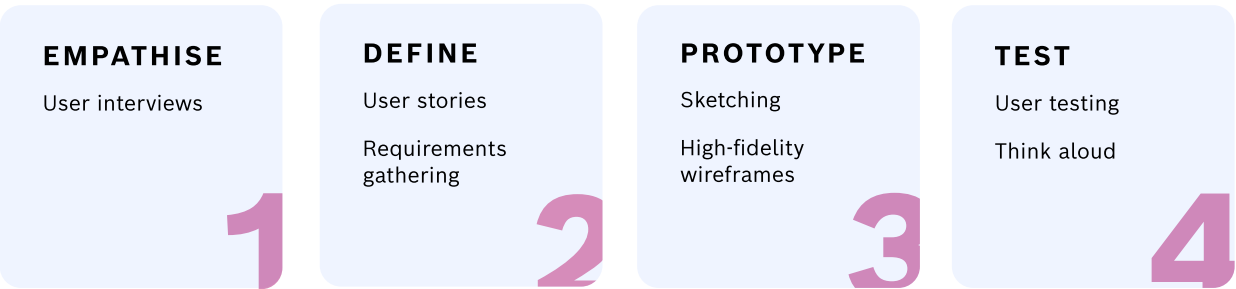

- Break-in Detection
- GPS Position Request
- Temperature Alarm
- Indoor Air Quality Measurement
- Fire Gas Detection

Project scope

Due to spexor's variety of features, there are several use cases in the B2B sphere. This project focuses on using the “Indoor Air Quality Measurement” feature in a B2B context. Additionally, I agreed with the stakeholder that the prototype is to be developed for a tablet device as its larger screen size is more suitable for B2B purpose.

Design process

Project results are available upon request.
